More Fun with ArgumentCollection

So, I went back and visited the thread on AttributeCollection and ArgumentCollection I talked about back on Wednesday, and I came up with another test I wanted to look at with ArgumentCollection:

```
<cfset request.test = {
    value1 = "One",
    value2 = "Two"
} />
<cfset request.test2 = {
    value3 = "Three",
    value4 = "Four"
} />

<cffunction
    name="OutputArguments"
    returntype="void"
    output="true"
>
    <cfargument name="argumentCollection" type="struct" requred="false" default="#request.test2#"/>

    <cfdump var="#ARGUMENTS#" label="From OutputArguments()" />
</cffunction>
```

I'm not sure what I expect the result to be, but the result I got isn't it:

View Example.
