BlogCFC Tweaks: Bug Fix for viewByCategory.cfm

Posted At : December 12, 2008 2:15 PM | Posted By : Jon Hartmann

I recently posted a blog entry with some code and instructions to allow drilling down into categories to view the posts in that category. Unfortunately, it had a bug. The meat of the viewByTemplate.cfm file should look like this:

```
<cfmodule template="../tags/datatable.cfm" data="#entries#" editlink="entry.cfm" label="Entries"
        linkcol="title" defaultsort="posted" defaultdir="desc">
    <cfmodule template="../tags/datacol.cfm" colname="title" label="Title" />
    <cfmodule template="../tags/datacol.cfm" colname="released" label="Released" format="yesno"/>
    <cfmodule template="../tags/datacol.cfm" colname="posted" label="Posted" format="datetime" />
    <cfmodule template="../tags/datacol.cfm" colname="views" label="Views" format="number" />
    <cfmodule template="../tags/datacol.cfm" label="View" data="<a href=""#application.rooturl#/index.cfm?mode=entry&entry=$id$"">View</a>"
sort="false"/>
</cfmodule>
```

Notice the missing "querystring" attribute on the datatable module. If you don't remove that bit, clicking on a blog post link from the category view wont take you to that blog post at all. I've updated the code in the relevant zip.

Download the updated code.
