

Utility Function: RenderTemplate()

This function is half-way to being a really nice function. I just wish that I could pass in arguments, or a structure to use as the variables available in the rendered template. I'd love to have that isolation...

```
<cffunction name="RenderTemplate" access="public" output="false" returnType="string">
    <cfargument name="path" type="string" required="false" />

    <cfset var local = StructNew() />

    <cfsavecontent variable="local.returnValue">
        <cfinclude template="#arguments.path#" />
    </cfsavecontent>

    <cfreturn local.returnValue />
</cffunction>
```
