Ok, so this is the final variation on this that I'm going to post, even though I know that there are **more efficient ways to handle element creation in AngularJS** than using the `ngIf` block I'm using here. I've update the previous examples so that we now have two types of rendering for form questions, and the values are still tied to the underlying options values.

[Edit in JSFiddle](#)

- [Result](#)
- [HTML](#)
- [JavaScript](#)
- [CSS](#)

```
<div ng-app="DemoApp">
  <div ng-controller="ExampleController">
    Choose Object: <select ng-model="currentObject" ng-options:

    <hr />

    <p ng-hide="currentObject">
```
