These two directives individually are pretty awesome, but they also go together really well, at least for demonstrating features. `ngList` converts string lists into arrays, while `ngPluralize` converts arrays into different strings based on the item count in the list. Both are important to know.

The image shows a blue sidebar menu. At the top, it says "Start with a boilerplate:". Below this, there is a "Close" button on the left. A list of items follows, each with a white circular bullet point on the left and a white rectangular background on the right. The items are: jQuery, Vue, React, React + JSX, Preact, TypeScript, CoffeeScript, SCSS, and CSS Grid.

- jQuery
- Vue
- React
- React + JSX
- Preact
- TypeScript
- CoffeeScript
- SCSS
- CSS Grid
