Utility Function: GetInstanceName()

I can't claim the core of this function as my own, it comes from a **presentation by Adam Lehman on ColdFusion server administration**. I wrapped his code snippet into a function for reuse.

```
<cffunction name="GetInstanceName" access="public" output="false" returntype="string">
    <cfreturn createObject("java", "jrunx.kernel.JRun").getServerName() />
</cffunction>
```
