Related Categories: ColdFusion, Utility Function

Some more "stolen" code for today's pair of utility functions. Thanks to [FusionGrokker's post on controlling mappings in CF7](#). As FusionGrokker points out, these functions work in CF7, but its actually hacking global mapping values, so you could have problems.

```
<cffunction name="CreateMapping" output="false" returntype="void">
    <cfargument name="mapping" type="string" required="true" />
    <cfargument name="path" type="string" required="true" />

    <cfset var factory = CreateObject("java", "coldfusion.server.ServiceFactory") />
    <cfset var mappings = factory.getRuntimeService.getMappings() />

    <cfset mappings[arguments.mapping] = arguments.path />

    <cfreturn />
</cffunction>

<cffunction name="RemoveMapping" output="false" returntype="void">
    <cfargument name="mapping" type="string" required="true" />

    <cfset var factory = CreateObject("java", "coldfusion.server.ServiceFactory") />
    <cfset var mappings = factory.getRuntimeService.getMappings() />

    <cfset StructDelete(mappings, arguments.mapping) />

    <cfreturn />
</cffunction>
```
