I really can't take any credit for this one. The idea and the core code come from [Pete Freitag's blog post "What CFLOCATION Does"](#). Its probably not even original to wrap it in a function, but here it is any way.

```
<cffunction name="PermanentRedirect" output="false" returntype="void">
    <cfargument name="url" type="string" required="false" />

    <cfheader statusCode="301" statustext="Moved Permanently" />
    <cfheader name="Location" value="#arguments.url#" />

    <cfabort />

    <cfreturn />
</cffunction>
```
