Utility Function: StructDeleteKeys()

I often need to delete struct keys based on a list of items. Its not that I can't just loop the list and call StructDelete(), but it gets old, and this function makes it a little easier.

```
<cffunction name="StructDeleteKeys" returntype="void">
    <cfargument name="struct" type="struct" requried="true" />
    <cfargument name="keyList" type="string" requried="true" />
    <cfargument name="delimiters" type="string" required="false" default="," />

    <cfloop list="#arguments.keyList#" delimiters="#arguments.delimiters#" index="key">
        <cfset StructDelete(arguments.struct, key) />
    </cfloop>

    <cfreturn />
</cffunction>
```
